

## Geography 360 November 3, 2016

## GIS data storage and structures

#### 1. Questions and Announcements

- Recognizable Seattles: A Class Perspective (~3800 votes!)
- Clarifications:

NO MEETING OR EXAM during Final Exam time.

Quiz II: December 2<sup>nd</sup>

Final project due during Exam week.

- Near/Far project:

Part I: ~6 people had the OSM website problem.

Part I: Not going to peer-review each other's OpenStreetMap contributions

Part II: Posted. Read it over today. There's an outdoor component.

#### 2. GIS Data: Storage and Structures

- Representing attributes
- Databases and local storage

How do we store information about the characteristics of spatial entities in GIS?

 Attribute data is typically stored in tables that are linked/associated with the spatial objects in your GIS.

 These tables help us in searching/retrieving objects based on their characteristics and in performing various analyses.

#### Visualizing Feature Geometries

#### Storing Associated Attribute Data in a Table

| Name        | FIPS  | Pop90 | Area | PopDn |
|-------------|-------|-------|------|-------|
| Whatcom     | 53073 | 128   | 2170 | 59    |
| Skagit      | 53057 | 80    | 1765 | 45    |
| Clallam     | 53009 | 56    | 1779 | 32    |
| Snohomish   | 53061 | 466   | 2102 | 222   |
| Island      | 53029 | 60    | 231  | 261   |
| Jefferson   | 53031 | 20    | 1773 | 11    |
| Kitsap      | 53035 | 190   | 391  | 485   |
| King        | 53033 | 1507  | 2164 | 696   |
| Mason       | 53045 | 38    | 904  | 42    |
| Gray Harbor | 53027 | 64    | 1917 | 33    |
| Pierce      | 53053 | 586   | 1651 | 355   |
| Thurston    | 53067 | 161   | 698  | 231   |
| Pacific     | 53049 | 19    | 945  | 20    |
| Lewis       | 53041 | 59    | 2479 | 24    |

Question: Where is the spatial data associated with these features?

Answer: Usually encoded in the table, too, but stored in an attribute/field that isn't made visible to you as a user.

# How do we store information about the characteristics of spatial entities in GIS?

- Attribute data is typically stored in tables that are linked/associated with the spatial objects in your GIS.
  - Seeming exception: You've seen how GeoJSON and (the user-facing parts of) OpenStreetMap use key=value pairs to store attribute data in lists, not in tables. So, in OSM, the attributes for Smith Hall are:

```
building=university,
name="Smith Hall",
operator="University of Washington", etc.
But behind the scenes, OSM uses tables...
```

 These tables help us in searching/retrieving objects based on their characteristics and in performing various analyses.

## Databases

 A database is a collection of data files that is organized to support data storage, manipulation, and retrieval.

 Databases are usually built/managed/used by a 'DBMS', a DataBase Management System.

 A 'spatial' database is usually at the core of a GIS program.

## Types of databases

- Different types of databases are used to organize GIS data.
   Among others:
  - Flat file systems
  - Relational databases
  - NoSQL databases, including graph databases.
- Relational databases presently most widely used in GIS.

## Some Terminology for Tables

# Attribute or Item

| Record |
|--------|
|--------|

|   | Name      | FIPS     |   | <sup>2</sup> op90 | Area | PopDn |
|---|-----------|----------|---|-------------------|------|-------|
|   | Whatcom   | 53073    |   | 128               | 2170 | 59    |
|   | Skagit    | 53057    | 1 | 80                | 1765 | 15    |
|   | Clallam   | 53009    |   | 56                | 1779 | 32    |
| Ì | Snonomish | <u> </u> |   | 400               | 2102 | 222   |
|   | Island    | 53029    |   | 60                | 231  | 261   |
|   | Jefferson | 53031    |   | 20                | 1773 | 11    |
|   | Kitsap    | 53035    |   | 190               | 391  | 485   |

Row = record = tuple

Column = field = item = attribute

A Flat File (one of the simplest forms of storage for a database system)

|        | Attribute | Attribute | Attribute |
|--------|-----------|-----------|-----------|
| Record | Value     | Value     | Value     |
| Record | Value     | Value     | Value     |
| Record | Value     | Value     | Value     |

| name    | surname   | address        | phone # | order# | item | qty | item | qty | item | qty | item | qty |
|---------|-----------|----------------|---------|--------|------|-----|------|-----|------|-----|------|-----|
| Leo     | Durocher  | 112 Beal St    | 5-1307  | 1      | CR7  | 1   |      |     |      |     |      |     |
| Rudy    | Valentini | 1 Hispanola Dr | 4-2706  | 2      | F15  | 1   |      |     |      |     |      |     |
| Paul    | Smith     | 99 Upstate Ln  | 0-0000  | 3      | GTO  | 3   | F15  | 1   | B52  | 1   | SR71 | 1   |
| Adam    | Smith     | 1 Wall St      | 1-2334  | 4      | 626  | 1   |      |     |      |     |      |     |
| Atom    | Ant       | 685 Hanbar Rd  | 4-1222  | 5      | B52  | 2   | CR7  | 2   |      |     |      |     |
| William | Smith     | 202 Dinkytown  | 9-9199  | 6      | F111 | 2   |      |     |      |     |      |     |
| Alice   | Paul      | 5 Free St.     | 4-4178  | 7      | SR71 | 1   |      |     |      |     |      |     |
| Paul    | Smith     | 99 Upstate Ln  | 0-0000  | 8      | F15  | 1   |      |     |      |     |      |     |

## Relational databases

 Imagine: Dividing up a big flat file into a series of smaller files or 'tables'.

Each kind of attribute has its own table.

• Tables can later be **joined** in various combinations by an analyst. The analyst specifies a attribute that both tables have – a **key**.

# A simple relational database example....

## **Property Table**

| PIN  | Sq Ft | Zone  |
|------|-------|-------|
| P101 | 244   | resid |
| P102 | 5000  | comm  |
| P103 | 6790  | mixed |

### **Owner Table**

| PIN  | <u>Owner</u> |
|------|--------------|
| P101 | Smith        |
| P102 | Whoozit      |
| P103 | Whatzit      |

## A more complicated example:

### Patient File

| Patient Record |          |                  |          |  |  |  |
|----------------|----------|------------------|----------|--|--|--|
| Key C          | Check-in | <b>Check Out</b> | Room No. |  |  |  |
| 42             | 2/1/96   | 2/4/96           | N763     |  |  |  |
| 78             | 2/3/96   | 2/4/96           | N712     |  |  |  |
|                |          |                  |          |  |  |  |

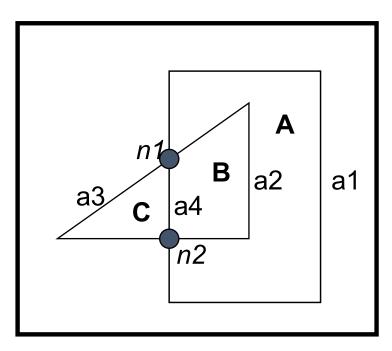

### Purchases File

| Purchase | e Record   |       |             |     |
|----------|------------|-------|-------------|-----|
| Item     | Date       | Price | Customer    | Key |
| Skate Bo | ard 2/1/96 | 49.95 | John Smith  | 42  |
| Baseball | Bat 2/1/96 | 17.99 | James Brown | 978 |

| Accident Report |                   |                   |     |                   |  |  |  |
|-----------------|-------------------|-------------------|-----|-------------------|--|--|--|
| Date            | Injury            | Name              | Key | Location          |  |  |  |
| 2/1/96          | <b>Broken Leg</b> | John Smith        | 42  | 75 Elm Street     |  |  |  |
| 2/2/96          | Concussion        | Sylvia Jones      | 654 | 12 State Street   |  |  |  |
| 2/2/96          | Cut on Ear        | <b>Robert Doe</b> | 123 | 2323 Broad Street |  |  |  |
|                 |                   |                   |     |                   |  |  |  |

Accident File

# Relational database structures can be used to implement the vector data model...

#### **Arc Coordinate Data**

| Arc | StartX | Y IntermediateXY           | EndXY |
|-----|--------|----------------------------|-------|
| a1  | 4,5    | (4,8), (8,8), (8,1), (4,1) | 4,3   |
| a2  | 4,5    | (6,7), (6,3)               | 4,3   |
| a3  | 4,5    | (1,3)                      | 4,3   |
| a4  | 4,3    |                            | 4,5   |

#### **Arc Topology**

| Arc | Start | End | Left | Right |
|-----|-------|-----|------|-------|
| a1  | n1    | n2  |      | Α     |
| a2  | n1    | n2  | Α    | В     |
| а3  | n1    | n2  | С    |       |
| a4  | n2    | n1  | С    | В     |

#### **Node Topology**

| Node | Arcs           |
|------|----------------|
| n1   | a4, a2, a1, a3 |
| n2   | a2, a4, a3, a1 |

### Polygon Topology

| ID | Arcs   |
|----|--------|
| Α  | a1, a2 |
| В  | a2, a4 |
| С  | a3, a4 |

## Why relational databases?

- Relatively simple to implement—well understood and ubiquitous in computing today.
- Can handle many data types.
- Encourages (requires) careful thinking in the design stages.
- Yet within the scope of a given design you've implemented, the relational database does <u>not</u> require prior knowledge about how you will *manipulate* data.

# Disadvantages/challenges of relational databases

- In an era with "big data," there may be practical limits to the scale at which data can be stored and queried in typical relational databases.
- Can perform poorly in representing and calculating with heterogeneous and dense relationships whose types may not be well understood ahead of time (compare: graph databases!)

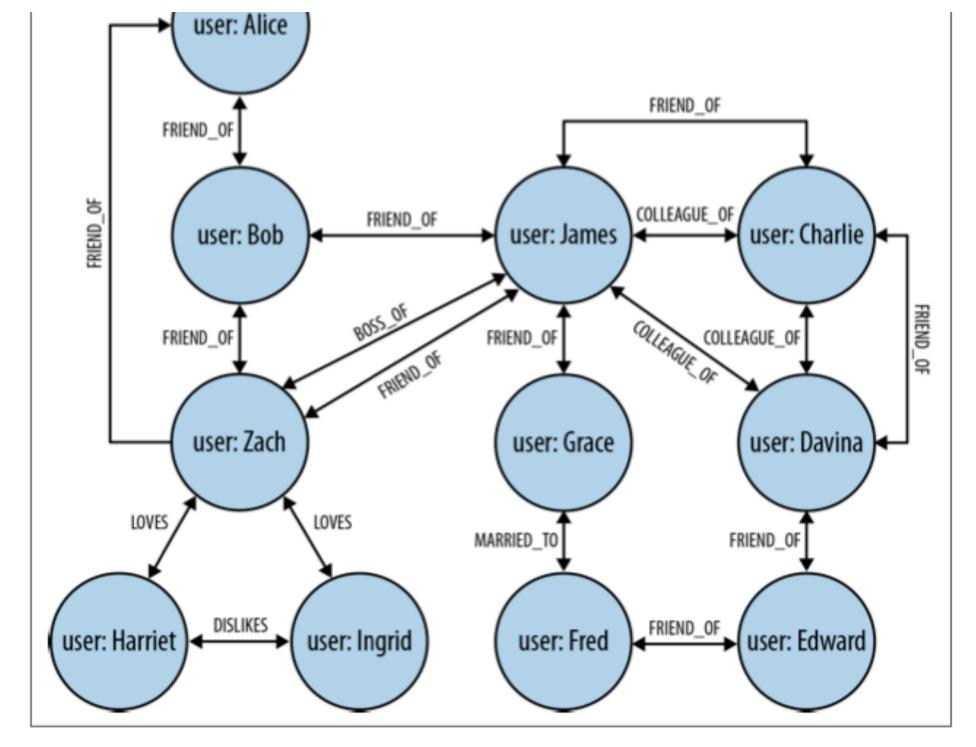

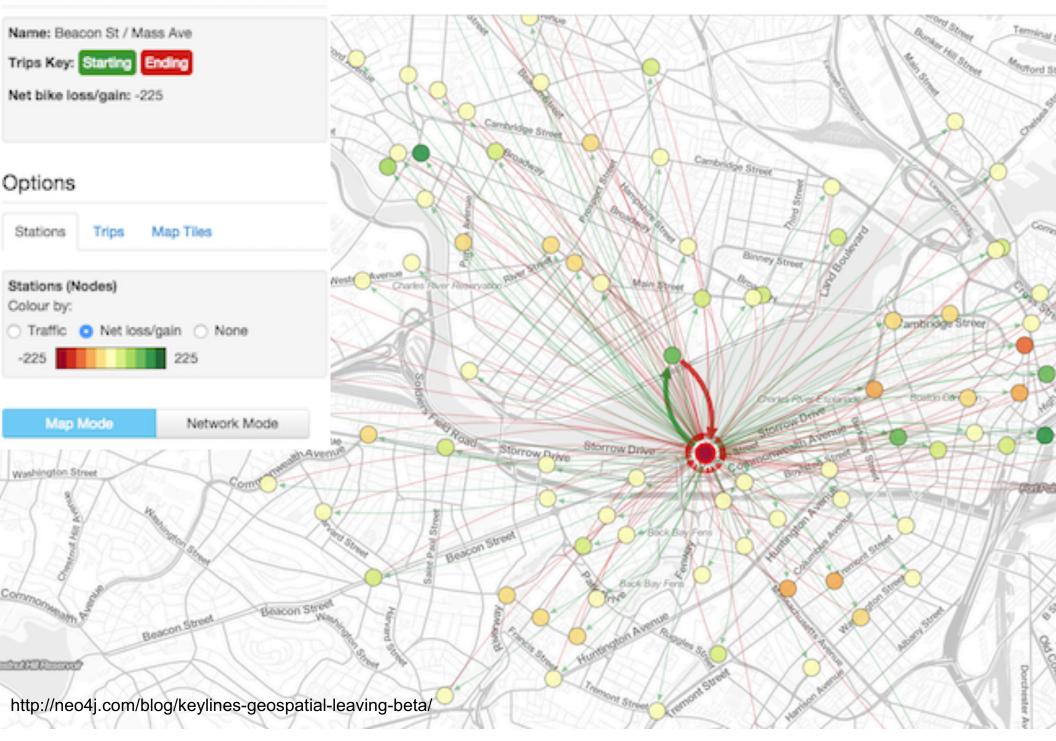

Figure 2-5. Easily modeling friends, colleagues, workers, and (unrequited) lovers in a graph

# Color shows net loss/gain of bikes by cycl share station in Boston.

#### Station Details

## DataBase Management Systems (DBMS)

 A DBMS is a software package that facilitates data storage, manipulation, and retrieval.

## A DBMS usually has:

- Data definition language
- Data dictionary ["metadata"]
- Data entry & update modules
- Report generator
- Query language
